

Remove IT Policy

If you have any 8xxx device the best method for removing IT policy is to update it to OS 4.5 and you can use JL_Cmdr's "resettofactory" command to remove ALL IT policy, Firewall restrictions and Application Permission settings. After you've upgraded to OS 4.5, simply backup the device using Desktop Manager, close Desktop Manager, then run JL_Cmdr and execute the "resettofactory" command. The device will wipe, then reboot leaving the OS, 3rd party apps but no data AND, best of all, NO IT policy whatsoever. When you're done, simply restore your backup and you're good to go with no policy or locked firewall. You can downgrade back to the old OS if you desire, too.

If your device is running OS 4.2 or lower [you will need to do the following located here.](#)
