

Network Access Control (NAC) Grows Up

NAC has evolved from a binary Yes/No control to an adaptive technology that can handle the gray areas in complex and unpredictable network environments. [Bradford Networks](#) pioneered 3rd generation NAC, and we're helping hospitals, universities, and leading companies use it to full advantage. IT staff can orchestrate many different personal devices and categories of users with a minimal investment of time and effort. Employees can use their preferred devices to become more mobile and productive, without putting the organization at risk. That's good news for end users, and good news for the business.
