

Sync contacts with your iOS device

To sync your Google contacts with your Apple iOS device (iPhone, iPad, iPod touch), we recommend using CardDAV, which is an Internet open standard. When you sync your Google contacts using CardDAV, you'll be able to edit, add, and remove contacts from your device and keep them in sync everywhere you use them.

Syncing via CardDAV is only available over SSL1 for Apple devices on iOS version 5.0 and above. If you use Google Apps for Business, use

[Google Sync](#)
to sync your contacts.

Here's how to sync your contacts to your device:

1. Open the **Settings** application on your device.
2. Select **Mail, Contacts, Calendars**.
3. Select **Add Account...**
4. Select **Other**
5. Select **Add CardDAV Account**
6. Fill out your account information in the following fields:
 - *Server*: Enter "google.com"
 - *User Name*: Enter your full Google Account or Google Apps email address.
 - *Password*: Your Google Account or Google Apps password. (If you've enabled [2 Step verification](#), you'll need to generate and enter an application specific password.)
 - *Description*: Enter a description of the account (e.g. Personal Contacts).
- Select **Next** at the top of your screen.
- Make sure that the "Contacts" option is turned to **ON**.

After you've completed setup, open the **Contacts** app on your device, and syncing will automatically begin.

Setting Google contacts as your default account

If you have set up iCloud, are syncing contacts from another account, or already have contacts stored on the device, you will need to select a Default Account.

CardDav & Google Sync Contacts

Set your default account

1. Open the **Settings** application on your device.
2. Select **Mail, Contacts, Calendars** and scroll down to the Contacts section. You will only see the Default Account option if you are syncing more than one account.
3. Select **Default Account**.
4. Select your Google contacts account. Your account will be labeled with the description you gave it in the Description field.

New and existing contacts

New contacts created directly on your iOS device will be added to your default account.

Existing contacts should be imported into Google contacts. If your contacts are stored on an Apple device, you can [transfer your contacts using vCard files](#) . If your contacts are stored with another provider, first [export your contacts](#) and then [import your contacts into Gmail](#)

Troubleshooting steps

If you have any problems, please try these things first:

1. Open the CardDAV account you established at Settings > Mail, Contacts, Calendars under Accounts. Make sure that the **Account** option is turned to ON.
2. If the Account is ON, then open **Advanced Settings** below and make sure **Use SSL** is turned to ON.
3. If you have changed anything, please click **Done** and the top right of the screen showing your account settings to save those changes.
4. If you're still experiencing issues syncing your contacts using CardDAV, please login to your Google account on the web. You might be prompted to acknowledge an "Unusual sign-in location".

If you are a developer looking for documentation, please [click here](#) to request it.

1. **SSL**: SSL (secure socket layer) is a way of changing data such as your username and password into code as it travels across the Internet, so that the data will be secure and private.

2.
