[Samsung site for Win 8 on the Samsung Series 7](#) ☐ ☐

A quick deployment checklist:

- Update the [BIOS to the latest version.](#)
 - [Change the bios to boot off legacy USB devices](#)
 - Install Windows 8 - [Options](#)
 - Install the Touch Screen Sensor [Firmware Config Update](#)
 - Install the ST Micro Rotation Sensor Driver [64-bit](#) or [32-bit](#) **
 - [Setup Bitlocker](#)
 - Setup Corporate or Consumer Anti-Virus
 - Install [MS Security Essentials](#) - **UPDATED**
- 9-21-12 - Latest Win8 Build already has Defender installed
- Complete & install MS Updates
 - Adjust - [Disable SMB 2.0 to allow Slate to see Samba etc.](#) **UPDATED**
- 9-21-12 - Careful here - it can have negative results of not implemented correctly - This setup stopped the workstation service and I am trying to recover. What I found out was the last step - complete this after you complete the first two. Also, do not add to any domain unless you have completed all 3 steps in the above link.
- Check device manager and update [missing driver](#)
 - Pin Apps and Folders to [Metro Desktop](#)
 - Optional - Install [Stardock Start8 taskbar](#) adjustment
 - Have Fun....!

** The latest distribution of Windows 8 does not suffer from this missing driver or at least the load that MS provided us did not exhibit symptoms from this missing driver issue.

While this is a basic list I have worked with when trying to get this device into our network environment there are other fixes and adjustments I am still working on.

If you have any suggestions or critique please let me know and good luck...

Today, one of our testors brought to my attention the battery life is about 2 hours! Not much to go on and by no means as lean as the iPad power consumption. But I digress and think this device is not in the same catagory as an iPad but a Hybrid Slate. (IMHO)
